Control of the LED cold light source via time switch or analyser

Order no.: LED_CTRL_CLAS

If you already have a timer, it can be used for controlling the LED cold light source.

A small control unit with rotary knobs and a red LCD display connects your timer with the 24V power supply unit and the LED cold light head.

Pre-selection of the operating mode with light color, paper grade, and intensity is done reproducibly at the control unit.
